Multilin™
F60
FEEDER PROTECTION SYSTEM

Advanced Protection, Control and Automation for Distribution Feeders

KEY BENEFITS

• The most flexible protection and control device for distribution feeder applications
• Unique and secure downed conductor detection, backed by many years of field experience
• Flexible load encroachment allows secure operation during heavy load conditions
• Voltage and frequency elements provide load shedding & transfer schemes for increased system uptime and stability
• Application flexibility with multiple I/O options and programmable logic (FlexLogic™)
• Phasor Measurement Unit (synchrophasor) according to IEEE® C37.118 (2011) and IEC® 61850-90-5 support

APPLICATIONS

• Primary protection and control for feeders on solidly, impedance or resonant (Petersen coil) grounded systems
• Busblocking/interlocking schemes
• Distribution load shedding schemes based on voltage and frequency elements

FEATURES

Protection and Control

• High-impedance fault detection (downed conductor detection)
• Directional, time, instantaneous, phase, neutral, negative sequence and ground overcurrent protection, plus restricted ground fault
• Load encroachment supervision
• Wattmetric ground fault detection
• Thermal overload, incipient cable fault detection and broken conductor
• Four-shot autorecloser with synchronism check
• Breaker control and breaker failure
• Abnormal frequency protection (rate of change, under/over frequency)

Communications

• Networking interfaces: up to three Ethernet ports 100Mb fiber or copper, RS485, RS232, RS422, G.703, IEEE C37.94
• Multiple protocols: IEC 61850, DNP 3.0 and Modbus® serial/TCP, IEEE 1588, IEC 60870-5-104 and 103, PRP, SNT, HTTP, TFTP, EGD
• Direct I/O: secure, high-speed exchange of data between URs for DG, distribution automation applications

IEC 61850 Process Bus Interface

• Robust communications with up to 8 HardFiber Bricks
• Redundant architecture for dependability and security

Monitoring and Metering

• Metering: current, voltage, power, energy, frequency and harmonics
• P & M class synchrophasors of voltage, current and sequence components: 1 to 120 frames/sec
• Advanced recording capabilities deliver a 1024 event recorder, configurable and extended waveform capture and data logger
• Setting for security audit trails for tracking changes to F60 configurations

EnerVista™ Software

• Graphical Logic Designer and Logic Monitor to simplify designing and testing procedures via EnerVista UR Engineer
• Service and update notification toolset ensures device documents and software are up-to-date via EnerVista Launchpad
• EnerVista Integrator providing easy integration of data in the F60 into new or existing monitoring and control systems
Protection and Control

The F60 feeder protection system provides feeder protection, control, monitoring and metering in an integrated, economical, and compact package. As part of the Universal Relay (UR) family, the F60 features high-performance protection, expandable I/O options, integrated monitoring and metering, high-speed communications, and extensive programming and configuration capabilities.

The F60 incorporates a unique and matured algorithm to detect high-impedance faults, such as downed conductor detection. It also provides fast and deterministic execution of programmable logic, which is necessary for substation automation applications. Graphical programming tools (Viewpoint Engine), supported by a library of logic components, make the F60 simple to use and configure.

The F60 has a wide range of protection elements that have many years of proven field experience. Protection and control features include:

Downed Conductor (Hi-Z) Detection

Fires, injuries, and even fatalities may be caused by a live downed conductor. Unfortunately, these high risk incidences often go undetected by conventional protective relays.

The Hi-Z element in the F60, unique to Multilin, provides reliable detection of faults caused by downed conductors. Sophisticated algorithms developed over the past 20 years, detect downed conductors, tree branch contacts, and insulation fault in underground cables. This unique, field-proven algorithm incorporates artificial intelligence to maximize dependability. Key benefits of Hi-Z detection in the F60:

- Reliable detection of faults caused by downed conductors
- Fast response to hazardous situations
- Dependable and secure operation using artificial intelligence
- Detection of arcing faults
- Easy integration by the addition of a Hi-Z module to a new or existing F60 relay

Directional Overcurrent Protection

The F60 also has built-in standard IEEE, IEC, IAC and FlexCurves™ overcurrent characteristics (TOC), most commonly used for primary and backup protection in various protective zones. It has phase

</table>
For neutral directional sensing, the residual current of the phase CTs is used as the operating current. For current polarization, a residual CT is used to measure zero-sequence current. For voltage polarization, the calculated or measured zero-sequence voltage can be used. The maximum torque angle is programmable. Two enhanced dual polarization modes use both current and voltage signals to determine polarity. “Dual-V” polarization gives priority to polarity determined based on voltage while “Dual-I” polarization gives priority to polarity determined based on current.

Load Encroachment
The load encroachment function in the F60 provides the capability to manage load growth in feeders. The load encroachment element can be set for the feeder’s expected maximum load, reducing the likelihood of false tripping for load conditions while maintaining dependability to trip for legitimate faults.

It allows the phase overcurrent elements to be set to see end-of-line phase faults in heavily loaded feeder applications.

Over/Under Voltage Protection
The F60 includes the following voltage elements:
- Up to 2 phase undervoltage and 3 phase overvoltage elements
- 1 auxiliary under/over voltage element
- 1 neutral overvoltage element

Abnormal Frequency Protection
The F60 offers over and underfrequency elements to improve network (grid) stability using voltage or frequency-based load shedding techniques. The F60 can be integrated into a communications network containing N60 network stability relays to implement wide area, intelligent load shedding schemes. It also provides backup protection when protecting feeders and other frequency-sensitive power equipment.

Frequency Rate of Change Protection
Frequency rate of change (df/dt) elements are included in the F60 to provide protection against system disturbances through load shedding and to provide anti-islanding protection for distributed generator interconnections.

Cold Load Pickup
A cold load condition can be caused by a prolonged outage of the load, by opening the circuit breaker, or by a loss of supply even if the breaker remains closed (cyclic loads like HVAC, refrigeration systems). F60 can automatically detect conditions that would lead to cold load pickup and selectively block protection elements for security during feeder energization.

Wattmetric Ground Fault Protection
A sensitive wattmetric zero-sequence directional function can be used on isolated or resonant (Petersen coil) grounded, low-resistance grounded and solidly grounded systems to detect ground faults.

This function determines the presence and direction of ground faults by measuring the value and direction of zero-sequence power. This flexible element responds to
power derived from zero-sequence voltage and current in a direction specified by the element characteristic angle. Power can be selected as active, reactive, or apparent. Therefore, the element may be used to sense either forward or reverse ground faults.

**Autorecloser**

Two autoreclose elements are provided for use with distribution lines in three-pole tripping schemes with up to two breakers. Up to four selectable recloser “shots” are possible prior to locking out. Any of the autoreclose elements can be dynamically blocked or unblocked by other elements or user logic. This way they can coordinate with the F60 protection setting groups.

**Synchronism Check**

The F60 provides four synchrocheck elements that monitor voltage difference, phase angle difference and slip frequency to ensure proper breaker closure as per user requirements. Any of the four synchrocheck elements can be dynamically blocked or unblocked by other elements or user logic. This way they can coordinate with the F60 protection setting groups.

**Breaker Failure and Control**

The F60 provides the required elements to perform two independent breaker failure functions. The F60 can provide independent breaker failure protection for both breakers on a feeder with a breaker-and-a-half or ring bus terminal. The relay also provides for the control of one or two breakers from faceplate pushbuttons, remote communications or contact inputs. A breaker position can be indicated by LEDs on the faceplate.

**IEC 61850 Process Bus**

The IEC 61850 Process Bus module is designed to interface with the MultiLin HardFiber System, allowing bi-directional IEC 61850 fiber optic communications. The HardFiber System is designed to integrate seamlessly with existing UR applications, including protection functions, FlexLogic, metering and communications.

The MultiLin HardFiber System offers the following benefits:

- Communicates using open standard IEC 61850 messaging
- Drastically reduces P&C design, installation and testing labor by eliminating individual copper terminations
- Integrates with existing F60’s by replacing traditional CT/VT inputs with the IEC 61850 Process Bus module
- Does not introduce new cyber security concerns

Visit the HardFiber System product page on the GE Digital Energy web site for more details.

**Advanced Automation**

The F60 incorporates advanced automation features including powerful FlexLogic programmable logic, communication, and SCADA capabilities that far surpass what is found in the average feeder relay. The F60 integrates seamlessly with other UR relays for complete system protection, including the unit and auxiliary transformers, and balance of plant protection.

**FlexLogic**

FlexLogic is the powerful UR-platform programming logic engine that provides the ability to create customized protection and control schemes, minimizing the need and associated costs of auxiliary components and wiring. Using FlexLogic, the F60 can be programmed to provide the required tripping logic along with custom scheme logic for auto transfer schemes (main-tie-main), load shedding based on frequency, voltage and communication, loop restoration schemes, other remedial action schemes and dynamic setting group changes.

**Scalable Hardware**

The F60 is available with a multitude of I/O configurations to suit the most demanding application needs. The expandable modular design allows for easy configuration and future upgrades.

- Flexible, modular I/O covering a broad range of input signals and tripping schemes
- Types of digital outputs include trip-rated Form-A and Solid State Relay (SSR) mechanically latching, and Form-C outputs
- RTDs and DCmA inputs are available to monitor equipment parameters such as temperature and pressure

**Monitoring and Metering**

The F60 includes high accuracy metering and recording for all AC signals. Voltage, current, and power metering are built into the relay as a standard feature. Current and voltage parameters are available as total RMS magnitude, and as fundamental frequency magnitude and angle. The F60 also measures up to the 25th harmonic on voltage and current, suitable for power quality applications.

**Fault and Disturbance Recording**

The advanced disturbance and event recording features within the F60 can significantly reduce the time needed for postmortem analysis of power system events and creation of regulatory reports. Recording functions include:

- Sequence of Event (SOE) - 1024 time stamped events
- Oscillography - 64 digital & up to 40 analog channels
- Events with up to 45s length
- Data Logger and Disturbance Recording - 16 channels up to 1 sample/cycle/channel
- Fault Reports - Powerful summary report of pre-fault and fault values
- Extensive breaker info (continuous coil monitor, arcing current, operating time, operation counter for asset management)

The very high sampling rates and large amount of storage space available for data recording in the F60 can eliminate the need for installing costly stand-alone recording equipment.

**Advanced Device Health Diagnostics**

The F60 performs comprehensive device health diagnostic tests at startup and
continuously during run-time to test its own major functions and critical hardware. These diagnostic tests monitor for conditions that could impact security and availability of protection, and present device status via SCADA communications and front panel display. Providing continuous monitoring and early detection of possible issues help improve system uptime.

- Comprehensive device health diagnostic performed at startup
- Monitors the CT/VT input circuitry to validate the integrity of all signals

Cyber Security - CyberSentry UR

CyberSentry UR enabled UR devices deliver full cyber security features that help customers to comply with NERC CIP and NIST® IR 7628 cyber security requirements. This software option delivers the following core features:

AAA Server Support (Radius/LDAP)

Enables integration with centrally managed authentication and accounting of all user activities and uses modern industry best practices and standards that meet and exceed NERC CIP requirements for authentication and password management.

Role Based Access Control (RBAC)

Efficiently administrate users and roles within UR devices. The new and advanced access functions allow users to configure up to five roles for up to eight configurable users with independent passwords. The standard “Remote Authentication Dial In User Service” (Radius) is used for authentication.

Event Recorder (Syslog for SEM)

Capture all cyber security related events within a SOE element (login, logout, invalid password attempts, remote/local access, user in session, settings change, FW update, etc), and then serve and classify data by security level using standard Syslog data format. This will enable integration with established SEM (Security Event Management) systems.

Communications

The F60 provides advanced communications technologies for remote data and engineering access, making it easy and flexible to use and integrate into new and existing infrastructures. Direct support for fiber optic Ethernet provides high-bandwidth communications allowing for low-latency controls and high-speed file transfers of relay fault and event record information. The available three independent Ethernet ports, redundant Ethernet option and the embedded managed Ethernet switch provide the means to create fault tolerant communication architectures in an easy, cost-effective manner without the need for intermediary communication hardware. The F60 supports the most popular industry standard protocols enabling easy, direct integration into DCS and SCADA systems.

- IEC 61850 with 61850-90-5 support
- DNP 3.0
- Ethernet Global Data (EGD)
- IEC 60870-5-103 and IEC 60870-5-104
- IEEE 1588 for time synchronization
- Modbus RTU, Modbus TCP/IP
- PRP as per IEC 62439-3

Interoperability with Embedded IEC 61850

Use the F60 with integrated IEC 61850 to lower costs associated with feeder protection, control and automation. GE Digital Energy’s leadership in IEC 61850 comes from thousands of installed devices and follows on extensive development experience with UCA 2.0.

- Replace expensive copper wiring between devices with direct transfer of data using GOOSE messaging for transfer tripping, interlocking schemes, loop restoration, and load shedding schemes.
- Configure GE systems based on IEC 61850 and also monitor and troubleshoot them in real-time with EnerVista Viewpoint Engineer
- Multicast IEEE C37.118 synchrophasor data between PMU and PDC devices using IEC 61850-90-5

Direct I/O Messaging

Direct I/O allows for the sharing of high-speed digital information between multiple UR relays via direct back-to-back connections or multiplexed through a standard DS0 multiplexer channel bank. Regardless of the connection method, direct I/O provides continuous real-time channel monitoring that supplies diagnostics information on channel health. Direct I/O provides superior relay-to-relay communications that can be used in advanced interlocking, generation rejection and other special protection schemes.

- Communication with up to 16 UR relays in single or redundant rings rather than strictly limited to simplistic point-to-point configurations between two devices
- Connect to standard DS0 channel banks through standard RS422, G.703

Fault 1

CB3

Fault 2

Fiber LAN, single or redundant, for added security

Reverse zone interlocking protection. By using the IEC 61850/GOOSE or hi-speed direct I/O capability blocking signals can be transferred upstream, allowing for minimal coordination delays. Fast clearance can be provided for Fault 1 while still maintaining coordination for Fault 2.
or IEEE C37.94 interfaces or via direct fiber optic connections

- No external or handheld tester required to provide channel diagnostic information

LAN Redundancy

Substation LAN redundancy has been traditionally accomplished by reconfiguring the active network topology in case of failure. Regardless of the type of LAN architecture (tree, mesh, etc), reconfiguring the active LAN requires time to switchover, during which the LAN is unavailable. UR devices deliver redundancy as specified by PRP-IEC 62439-3, which eliminates the dependency on LAN reconfiguration and the associated switchover time. The UR becomes a dual attached node that transmits data packets over both main and redundant networks simultaneously, so in case of failure, one of the data packets will reach the receiving device with no time delay.

Multi-Language

UR devices support multiple languages: English, French, Russian, Chinese, Turkish and German. These language options are available on the front panel, in the EnerVista setup software, and in the product manuals. Easily switch between English and an additional language on the local displays without uploading new firmware.

EnerVista Software

The EnerVista suite is an industry-leading set of software programs that simplifies every aspect of using the F60 relay. The EnerVista suite provides all the tools to monitor the status of the protected asset, maintain the relay, and integrate information measured by the F60 into DCS or SCADA monitoring systems. Convenient COMTRADE and SOE viewers are an integral part of the UR setup software included with every UR relay, to carry out postmortem event analysis and ensure proper protection of system operation.

EnerVista Launchpad

EnerVista Launchpad is a powerful software package that provides users with all of the setup and support tools needed for configuring and maintaining Multilin products. The setup software within Launchpad allows for the configuration of devices in real-time by communicating using serial, Ethernet, or modem connections, or offline by creating setting files to be sent to devices at a later time.

Included in Launchpad is a document archiving and management system that ensures critical documentation is up-to-date and available when needed. Documents made available include:

- Manuals
- Application Notes
- Guideform Specifications
- Brochures
- Wiring Diagrams
- FAQ’s
- Service Bulletins

Viewpoint Monitoring

Viewpoint Monitoring is a simple-to-use and full-featured monitoring and data recording software package for small systems. Viewpoint Monitoring provides a complete HMI package with the following functionality:

- Plug-&-Play Device Monitoring
- System Single-Line Monitoring & Control
- Annunciator Alarm Screens
- Trending Reports

Power System Troubleshooting

The F60 contains many tools and reports that simplify and reduce the amount of time required for troubleshooting power system events, increase uptime and reduce loss of production.
Typical Wiring

- Automatic Event Retrieval
- Automatic Waveform Retrieval

**Viewpoint UR Engineer**

Viewpoint UR Engineer is a set of powerful tools that allows the configuration and testing of GE relays at a system level in an easy-to-use graphical drag-and-drop environment. Viewpoint UR Engineer provides the following configuration and commissioning utilities:

- Graphical Logic Designer
- Graphical System Designer
- Graphical Logic Monitor
- Graphical System Monitor

**Viewpoint Maintenance**

Viewpoint Maintenance provides tools that will create reports on the operating status of the relay, simplify the steps to download fault and event data, and reduce the work required for cyber security compliance audits. Tools available in Viewpoint Maintenance include:

- Settings Security Audit Report
- Device Health Report
- Single-Click Fault Data Retrieval

**EnerVista Integrator**

EnerVista Integrator is a toolkit that allows seamless integration of Multilin devices into new or existing automation systems. Included in EnerVista Integrator is:

- OPC/DDE Server
- Multilin Drivers
- Automatic Event Retrieval
- Automatic Waveform Retrieval

**User Interface**

The F60 front panel provides extensive local HMI capabilities. The local display is used for monitoring, status messaging, fault diagnosis, and device configuration. User-configurable messages that combine text with live data can be displayed when user-defined conditions are met.
