Decarbonization, Digitization, Decentralization, and Electrification trends are leading to the current changing energy landscape. This includes wide proliferation of Distributed Energy Resources (DERs), which is being driven by the following factors:

**Changes in policy and regulation**
Globally countries have set targets for the increase of renewable energy and reduction of greenhouse gas emissions. For example, the UK is aiming to reduce 20% of greenhouse gas emissions by 2020. In the US, many states have recently set renewable energy targets for 2020 and beyond.

**Security of supply**
As traditional fossil fueled generation plants are reaching end of life, countries need to find new sources to meet their growing demand. Implementing and managing multiple energy sources, including renewable generation, helps to maintain energy security. Furthermore, local management of DERs reduces supply chain risks associated with traditional energy sources.

**New revenue streams**
Attractive feed-in tariffs for renewable generation have seen new investors outside the traditional energy industry investing in renewables bringing new entrants to the market. New commercial models are emerging including peer to peer energy transactions.

**Increasing availability and affordability**
As DERs are becoming more cost effective and readily available, there is a rise of the prosumer, where customers are both the producers and consumers of electricity.

**Helping enhance productivity through energy surety**
When industrial and manufacturing companies lose power, it can cost millions of dollars in down-time, waste and equipment damage. Implementing distributed energy resources enable industrial customers to continue operating even if the main grid is down.

Utilities and power producers must adapt and ensure they can find an optimal balance between supply and demand, and facilitate market changes to ensure reliable and economic operation. Integrated Microgrid Systems provide the set of solutions that are needed to manage Distributed Energy Resources efficiently and can also help the grid address the growing demand while enabling higher levels of devolved control.
WHAT IS A MICROGRID?

A microgrid is a contiguous section of the grid consisting of interconnected Distributed Energy Resources (DERs) and loads under common control. DERs can be distributed renewables, generators, storage devices, electric vehicles and demand response. Microgrid controls can optimize the power mix of the DERs and loads to provide reliable and economic operation to the end users.

Microgrid controls can also provide a resiliency service by operating the microgrid as an independent electrical island disconnected from the rest of the grid if required. There are different types of microgrids including:

Permanently Islanded Microgrids
These are off-grid systems where only locally generated power is consumed to meet the needs of the local demand.

Grid Connected Microgrids
These can produce and distribute power within its local distribution network as well as import power from a utility source.

Virtual Power Plants and Microgrids
A Virtual Power Plant (VPP) differs from a microgrid in that a VPP is typically associated with energy resources but not within a specifically defined grid boundary or grid sections. A VPP could be associated with, and operate within, a microgrid if the VPP resources are connected within the microgrid. Alternatively, a VPP can be a collection of microgrids.

BENEFITS OF MICROGRIDS

Microgrids can improve the electrical network through an optimized balance between supply and demand, where customers are able to dynamically utilize the most economic mix of supply and integrate variable supply resources. This is done through:

- **Generation forecast and automated control**
- **Dispatch commitment scenarios and optimized DERs**
- **Integrating and managing renewables and energy storage**

In addition, microgrids can help facilitate the energy trading mechanism and enable market transaction integration with utilities providing proactive management of existing energy contracts.

ANNUAL INSTALLED CAPACITY ACROSS DER MARKET IS EXPECTED TO GROW TO 335.8 GW IN 2024
GE SOLUTION

GE's microgrid solution is a field proven, modular and comprehensive offering that integrates primary equipment, intelligent controls and communications, with advanced visualization and supervisory control software to monitor, track, and forecast load and generation resources within the microgrid network. Each solution is tailored to the application and the customers’ primary objectives.

Consulting services include:
- Technical and economic feasibility studies
- Business case development
- Detailed engineering designs
- Grid interconnection studies
- Protection and controls

The system components include:
- Energy storage solutions
- Microgrid control system and Communications
- Microgrid Energy Management System
- Inverters and Balance of Plant
- Generation solutions – gas, hydro & wind
- Services (engineering, project management, installation & commission, maintenance and asset performance management services)

Protective Relays
Typical Applications Include:
- Real Time Operations
- Transition Management
- Optimization and Dispatch Control
- Operational Planning
- Energy Transaction Management
- Analytics and Reporting

The solution can be delivered as:
- Engineering Solutions & Services
- Technology & Equipment
- Full Engineering, Procurement and Construction
GE ADVANTAGE

GE is globally recognized for designing, delivering and servicing customized microgrid solutions for diverse applications. GE is able to offer a comprehensive solution including feasibility studies and network analysis, project management and design, primary and secondary equipment, controls and advanced visualization tools. Working with GE, customers can realize the following business outcomes:

- **Improve grid reliability**
  With GE’s uniquely designed solution for grid resilience, energy and system reliability

- **Reduce Op-Ex**
  Advanced operation controls for energy bill reduction, demand response efficiencies and power mix optimization

- **Improve financial performance**
  Monetize the value of assets through new revenue streams

- **Increase operation efficiency**
  Single platform for managing grid assets, generation assets, customers (loads), markets and other counter parties

INTEGRATED, TAILORED SOLUTIONS FROM CONSULTING SERVICES TO SYSTEM OPTIMIZATION
GE APPROACH

GE partners with customers to define the project scope and vision. This process begins with the development of the “Microgrid Energy Master Plan,” when GE consultants perform the cost-benefit analysis of different scenarios to define the multi-year roadmap of capital projects supported by operation and maintenance projects. Our approach results in a formalized business case with an investment-grade system engineering design that provides the basis of project planning and financing. GE can deliver the turnkey implementation with O&M service agreements.

GE’s System Approach

System Design Process & Optimization

Once the project scope, business objectives and services are understood, GE’s technical experts will scope the energy sources, equipment and services required. Then, utilizing an advanced optimization tool, GE delivers an a tailored solution to meet the customer’s requirements and business objectives.

GE MICROGRID SOLUTION

CUSTOMER INPUTS

- BASICS
  - Generation requirements
  - Existing equipment
  - Desired outcome and priorities
- SPECIFICS
  - Load profile
  - Critical loads
  - Equipment characteristics
  - Technical requirements

GE INPUTS

- Inverters
- Wind Turbine / PPA
- Batteries
- Communications
- Microgrid Control & Energy Management System
- Protective Relays
- Engineering Services
- Solar

GE OPTIMIZATION

SERVICE AGREEMENT

Training, Operation, Long Term Services

ENGINEERING SOLUTIONS & SERVICES

Design, Configuration, Integration, Installation, Commissioning and Testing

SYSTEM ENGINEERING

Feasibility and Planning Studies

BUSINESS CASE

Cost-benefit Simulation Analysis
APPLICATION EXAMPLES

APPLICATION MILITARY PROJECT NAVY SHIPYARD LOCATION PHILADELPHIA

Challenge
Meet the existing and future electricity capacity needs and integrate on-site generation and storage capabilities to reduce and flatten the overall load curve of the campus. Ensure greater energy efficiency and power system availability.

Solution
A suite of power system modernization solutions and a grid connected microgrid system for resilient, reliable power including:
- Microgrid Energy Management System
- e-terra software platform (Microgrid-SCADA & Microgrid-DMS)
- Digital Substation - Agile protection and control relays
- DS Agile – DAPserver grid automation controller
- Reason Ethernet switches
- Nanogrid controllers

APPLICATION INDUSTRIAL PROJECT ALUMINIUM PRODUCTION FACILITY LOCATION UNITED ARAB EMIRATES

Challenge
Ensure maximum uptime for continued and safe plant operations in the event of utility power loss.

Solution
Microgrid system with fast loadshed capabilities to enable:
- Optimal integration and management of renewable generation including solar and back-up for maximum process uptime
- Seamless transition of power from utility source to on-site generation
- Fast loadshed of non-critical loads if load exceeds available generation

APPLICATION CAMPUS PROJECT UNI. OF ONTARIO INSTITUTE OF TECH. LOCATION CANADA

Challenge
Reduce electricity costs on campus while maximizing renewable sources, and provide a seamless transition between grid connection and on-site generation for critical loads during grid failures.

Solution
Campus-based microgrid system with monitoring and control capabilities delivering:
- Active system to optimally control Battery Energy Storage System (BESS) and other energy storage sources based on different forecasting engines, providing a seamless transition in case of grid failure
- Simulation tool to evaluate the performance of the control system when faced with different load and electricity prices
- Monitoring system to provide status, event, and alarm management with remote data access
**Application**  
SMART CITY MICROGRID

**Project**  
NICE GRID

**Location**  
NICE, FRANCE

**Challenge**  
Enable the prosumer to efficiently take advantage of significant photovoltaic distributed generation and energy storage, by enabling islanding for secure supply and provide demand response solutions for flexible consumption.

**Solution**  
Grid modernization solutions delivering a community based microgrid including:

- e-terra Platform Distributed Energy Resource Management Solution (DERMS)
- Microgrid Energy Management System
- DS Agile microgrid controller
- DAPserver substation SCADA SA-DA platform
- Agile protection and control relays
- Reason Ethernet switches

---

**Application**  
UTILITY

**Project**  
ISSY GRID

**Location**  
ISSY-LES-MOULINEAUX, FRANCE

**Challenge**  
Reduce consumption peaks and ensure grid balance while reducing the carbon footprint of the district.

**Solution**  
District level microgrid system to optimize energy efficiency for a variety of loads including: commercial, residential, street lighting, EV charging and public buildings. GE’s microgrid solution provides monitoring and control of:

- Renewable generation integration
- Energy storage
- Smart street lighting
- EV charging

---

**Application**  
COMMUNITY RESILIENCY

**Project**  
POTSDAM NY MICROGRID

**Location**  
POTSDAM, NY USA

**Challenge**  
This town in northern New York, near the Canadian border, had experienced significant winter ice storms that wiped out power to much of the town and its critical and emergency response infrastructure for an extended period of time, putting the community and its residents at risk.

**Solution**  
GE’s Energy Consulting business partnered with National Grid, Clarkson University and Nova Energy specialists to engineer the technical and economic designs for a resilient microgrid for the community. This project is part of the state’s larger “Reforming the Energy Vision” initiative, also known as NY REV. GE’s scope of the solution includes:

- Business case development
- Economic dispatch modelling
- Interconnection and stability studies
- Distribution infrastructure, communications and controls design and engineering
KEY COMPONENTS

Microgrid Services
GE provides a full range of services from microgrid design and simulation to optimizing microgrids for resiliency, reliability, up-time and performance. GE’s service agreements are customized based on the customers’ requirements. Microgrid owners can lower their operating costs and mitigate operational and financial risks. GE’s services include:

Microgrid Advisory Services:
- Concept plan
- Load analysis and DER specification
- Cost-benefit analysis and energy master plan

Microgrid Engineering Services:
- Feasibility Studies
- System Studies (transient and steady state)
- Configuration
- Integration
- Installation & Commissioning
- System Testing

Microgrid Operation & Maintenance Services
- Multi-year service agreement
- Performance and availability based contract
- Preventive and condition based maintenance
- Asset Performance Management (APM)
- Grid modernization and upgrade

Microgrid Energy Management System
GE’s Microgrid Energy Management System (MEMS) is a single, unified platform for microgrid planning and operation optimization. Operators are able to monitor, optimize and control the system to reduce the overall energy cost and improve system reliability and resiliency. The MEMS is a multi-layer control system with the following components:

Microgrid Supervisory Control Room
Utilizing GE’s e-terraMicrogrids, this advanced grid control room software solution powers more than 70% of utility grid control centres enabling activities from “operation planning” to “after the fact” scenarios.

Microgrid Middleware Communication Platform
GE’s e-terraMBus provides field proven, unified communications middleware supporting both real-time (e.g. microgrid SCADA) and non-real-time (e.g. OpenADR) messaging.

Nanogrid Automation Controls for Distributed Energy Resources at Building Level
GE’s e-terraMEdge delivers distributed intelligence and control automation at the building level to forecast and optimize DER assets and loads.
Microgrid Automation Control System (MACS) consist of a powerful multi-functional automation controller that has software that is specifically designed, tested and validated for the control of microgrids.

The MACS Controller supports applications for real-time operations control, transition management, optimal dispatch, and operational planning. Each application and system can be designed and configured based on the system requirements.

Energy Storage Solution
GE’s Reservoir solution is a flexible and modular energy storage solution for AC or DC coupled systems. This innovative and standardized architecture is designed for energy, power and renewable applications.

The Reservoir solution is an integrated turnkey offering that combines GE’s advanced technologies and expertise in controls, power electronics, battery and operational management systems, and electrical balance of plant – all backed by GE’s performance guarantees.

FROM OPERATIONAL SOFTWARE AND INTELLIGENT CONTROLS TO ENERGY STORAGE AND SERVICES, GE DELIVERS COMPREHENSIVE MICROGRID SOLUTIONS
